Policy recommendations on urban strategic planning

They are conceived as key orientations to ensure local government’s access to strategic planning and concerns different actors represented by the following letters:

1. Africa

- In both countries, municipalities recognize the need for planning in general and strategic planning specifically. Municipalities are: leaders, politicians, technicians, and stakeholder.

- It is important that the planning process is valued, and that necessary time and resources for effective planning are duly allocated to this. In developing countries, the pressure to deliver and to be seen to deliver quickly on electoral promises has sometimes led to a short-circuiting planning, research and development, often with unintended consequences.1

- Mechanisms need to be put in place to increase the revenue raising ability of municipalities and reduce their reliance on central government transfers, and on donor funding. At the same time, clear and transparent criteria for funding from central government need to be put in place, to ensure stability and facilitate strategic planning.

- There are difficulties in aligning the planning and actions of all players at local level, and a strong framework for all municipalities is needed to structure intergovernmental relations and promote cooperative governance, always with the principle of subsidiary. Doubling of functions should be avoided, or being limited in time.

- Small, rural municipalities usually require specific attention and national interventions, given their limited revenue raising potential, high poverty levels, and high levels of service backlogs. Planning tools related to transfers of funds, and capacity building efforts from central government are necessary over the long term.

- Associated with this, there is a need to clarify the roles and responsibilities, or powers and functions, of all parties, and to make sure that local government is provided with the necessary resources to develop the capacity needed to perform its mandate.

- Strategic planning needs to be tied to the budget, and to the performance of senior municipal personnel (through Performance Management Systems).

- To a certain extent it is necessary to ‘sell’ the concept of strategic planning, and the central significance of municipal planning, particularly to national government. Besides the framework, a possibility could be strategic inter regional dialogues that also involve provincial and central governments to listen to “ideas from the ground”

- In both countries, spatial planning needs to improve in order to achieve the goals of strategic plans.

---

1 For example, in South Africa, the rapid construction of large low income housing developments on the outskirts of urban areas may well compromise the municipality’s ability to deliver services in a sustainable manner over the long term, possibly with negative political consequences in future. More thorough and intensive planning could obviate this.
Developmental local government and decentralization means that in planning the citizen is seen as the focus or target. This requires a participatory approach, and “ownership” of the planning process by local officials, politicians and residents. Associated with enhanced public participation is increased accountability of municipal officials to local residents. This can be addressed through the use of techniques such as the citizen report card, or quality of life survey.

Strategic plans need to be short and clear, and easily communicated. Local government in recognizes the need to increase ownership of their strategic planning process, and thus to emphasize in-house planning, reducing the reliance on external consultants. Associated with enhanced public participation is increased accountability of municipal officials.

Developmental local government requires greater levels of capacity and resources at local level than has been the case before. This includes needing to develop effective financial management systems and budgeting processes.

The institutional arrangements associated with strategic planning for local development need careful attention. In many municipalities in Mozambique there is no separate planning department, and planning is done on an ad hoc basis. In South African municipalities, there should be an Integrated Development Planning manager, in addition to a municipal planning department. However, the seniority and experience of the IDP manager is not always in line with the importance that should be granted to strategic planning.

In all municipalities, local leadership and political support at all levels are critical to achieving effective strategic planning. Leaders and senior personal could be rewarded and have access to specific capacity building on strategies.

Strategic planning involves making strategic choices, recognizing that it is impossible for even the most capacitated municipality to accomplish all its goals alone. Partnerships and strategic choices therefore need to be made, in line with the overall strategic plan and vision of the municipality.

It is important that international partnerships link and support existing strategies to be implemented, and are conducted in conjunction with municipal representatives, and that mechanisms are put in place for sharing experiences (both positive and negative) across municipalities within, and between, each country.

For strategic planning to result in greater local development, it is important that it is accompanied by implementation plans which deliver improved service delivery.

2. Latin America

Urban Strategic Planning is crucial to:

- Further the decentralization process, because it helps to channel new competences at the local level and it contributes to renewed inter-governmental relations.

- Promote Public-Private partnerships by making sure that the terms of the venture are discussed with and agreed upon by the local governments, giving that the fields traditionally covered by such projects are core competences of local authorities. The commitment process of the private and the public sector on PPP should go through a social, environmental and financial diagnosis, to result in clear agreements on an action plan and on the mitigation of its negative impacts and build consensus on medium and long term strategies, evacuating the daily trouble shooting perspective”. 

- Direct the budget of the local governments (1) on the short term, to set up structuring and integrating projects and (2) on the long term, to align with national priorities and to better the process of local democracy.
- We Promote not only a balanced and effective provision of public services but also improve the integration of the lowest classes through innovative solutions in the access to such services and to sustainable urban housing directed towards social cohesion.

- Help to build new spatial patterns for the use of land and urban form, respecting the principles of property, social mixing, limitation of urban sprawl and variety of usages.

- Emphasize that environmental issues are not only second-plan challenges but crucial points to promote urban sustainable development and encourage adapted in-house solutions such as local energy markets, biodiversity protection plans, waste management facilities, housing GHG emissions reduction...

- Build capacities and social strengths leading to a greater territorial integration and governance, allowing in return the participation and articulation of actors within the objectives and projects of transformation. This will reinforce the feeling of belonging and identity among the citizens, through a collective city project,

- Address and work transversally, and in an integrated manner, on various dimensions of the urban and territorial problem (economic, social, institutional, cultural and environmental)

- Manage the cities in a globalized environment and help them to face the changes with the necessary flexibility and adaptability

- Put the citizens in the centre of attention, relating their needs, rights, and duties to space, territory, time, and social fabric (Medellin)

Recommendations and suggestions:

- Land should not be monopolized nor segregated but should instead reflect the openness and the plurality of society.

- The inequalities remain in the cities and must be overcome, by encouraging inclusion and integration and mitigating the effects of speculation especially on the housing sector.

- (B) Local Authorities are best indicated to lead Urban Strategic Planning. Strong leadership, confirmed by local elections, public participation and commitment, ensures that the process is owned by the citizens and the local public administration and not seen as an external procedure.

To private sector

- Land should not be monopolized nor segregated but should instead reflect the openness and the plurality of society. Land property and development implies social and environmental responsibilities that adapt to a long-term compact city model and enables sustainable urban housing and development.

- The identity of a city is also expressed by the constructions and build environment. Design competitions and design guidelines transmit the public interest in quality of live for all and should be respected and developed jointly with interest groups

Recommendations related to LED and decent work (proposition)

- Urban spaces and neighbourhood should be vital, safe, and beautiful, and hold the identity of its location; not only as a matter of aesthetics, but of economics and competitiveness to attract people and capital and root social interaction to keep productive population in the cities.
Further, we encourage involving voluntary and community organizations into service delivery, so introducing more contestability in the delivery at the local level.

The informal economy undertakes many activities that are, even if in a low-key way, important assets to the local economy. Through planning, negotiation, simplified regulation and assistance in upgrading activities those become strong and sustainable.

- All municipalities have a responsibility to procure goods and services and can influence the amount of employment generated in making public purchases. They can also ensure the established standards for working conditions rather than unrestricted competition and downward pressure (decent work principles). The procurement in construction can become a potentially important mechanism for the implementation of labour standards.

- Starting from local skills and the knowledge and experience of local businesses, efforts should go into building on these, creating ‘clusters’ that can synergise and interconnect into a broader capacity to increase market share in sectors where enterprises in the city already have a presence.

Environmental related to environment and urban food supply

Planning avoids scarcity, degradation and contamination of land, water and forest resources and prevents the risk of disasters of predominantly poor populations exposed to floods and landslides.

Sustainable building will contribute to a better management of natural resources and energy efficiency, and should correspond to the principle of recycling and regeneration of urban areas and public transport.

In order to ensure access of the urban population to safe food and healthy and secure environments, rural and urban local governments cooperate to create favorable conditions to produce, process and distribute food in favor of local markets.

In national funding schemes and incentives, legal and fiscal changes should promote regeneration as equally contributing to local economic development, both regarding development areas or business incentives. Incentives for regenerating, repairing and restoring are equally important to incentives for new development, and prepare to adapt to change.
